

TerraLUX announces new LED Light Engine MicroStar1 LED replacement bulb (TLE-10)

TerraLUX is now shipping the latest member of the TLE series of LED Light Engine replacement bulb kits for the Maglite flashlights. This newest member of the line up is unique in the following ways:

1. The MicroStar1 is the first LED replacement kit ever made for the smallest focusable Mini Maglite, which uses the tiny AAA batteries and fits conveniently in a shirt pocket. This brings this tiny unit brighter light with a bulb that does not burn out (100,000 hours life time) and is almost indestructible.
2. The MicroStar1 uses the latest surface mount LED technology from Nichia, not currently available on the market in any flashlights. This provides 20 lumens of light and runs for 6 hours on two inexpensive alkaline AAA batteries.
3. The first replacement kit in the world to come with two specially designed replacement reflectors, which allow this product to be used in not only the AAA Mini Maglite, but also the AA Mini Maglite. This gives consumers a chance to experience this product in either of two of the most popular Mini Maglite flashlights available in the market today. In both cases, the design allows the user to focus the flashlight similar to the regular incandescent bulb.
4. This kit works great in “candle mode” where the head is taken off and the tail end of the barrel is placed in the upside down head to form a candle like lighting device. The new kit gives excellent light distribution in all directions making this a very effective lantern light.
5. This product breaks the retail price level of under \$20 for a high powered 20 lumen replacement bulb. Now customers can try out TerraLUX high powered LED Light Engines for under \$20 in two, not one flashlight with the MicroStar1 kit. Also provides wholesalers chance to sell more AAA Mini Mags which are rarely available in general retail stores.

Note: Maglite refers to BOTH the Mini AA and Mini AAA flashlights as Mini Maglites.

MicroStar1 (TLE-10) on a penny.
